            the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of AEB56764 to ABB6771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (I), (MI) and (KI) are useful for detecting enterovirus target sequence. (I) sensitively and selectively recognizes the enterovirus genome. (I) sensitively and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes. The present sequence represents a viral 5' untranslated polynucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of ARBS6762 to ARBS6771; and (b) a sequence required for selected amplification or detection. Also described: (I) a kit (KI) comprising (I), and one or more container that contains (I); and (2) detecting (MI) am enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ARBS6764 to ARBS6771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (I), (MI) and specifically and selecting enterovirus target sequences: (I) sensitively and rapidly detects fewer than 500 copies of enteroviral genome. (I) sensitively and rapidly detects fewer than 500 copies of enteroviral
(a) amplifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                 Gaps

The invention relates to an oligomucleotide (I) consisting of: (a) the target binding sequence of an oligomucleotide chosen from any one of the carget binding sequence of ABB56771; and (b) a sequence required for selected amplification or detection reaction. Also described: (I) a kit (KI) comprising (I), and one or more container that contains (I); and (2) detecting (MI) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABB56764 to ABB56771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (I), (MI) and (KI) are useful for detecting enterovirus target sequence. (I) specifically and selectively recognizes the enterovirus genome. (I) sensitively and rapidly detects fewer than 500 copies of enteroviral senome and allows detection of broad range of enterovirus serotypes. The present sequence represents a viral 5' untranslated polymucleotide sequence given in the exemplification of the present invention.
                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of ABB56762 to ABB56771; and (b) a sequence required for selected amplification or detection reaction. Also described: (l) a kit (K1) comprising (l), and one or more container that contains (l); and (2) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABB56764
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          to AEB56771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (I), (M1) and (K1) are useful for detecting enterovirus target sequences. (I)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           invention relates to an oligonucleotide (I) consisting of: (a) the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 specifically and selectively recognizes the enterovirus genome. (I) sensitively and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             present sequence represents a viral 5' untranslated polynucleotide sequence given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  100.0%; Score 19; DB 14; Length 237; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ठ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          to AEB56771 and optionally a sequence required for selected amplification reaction, and (b) detecting the amplified target sequence. (I), (MI) and (KI) are useful for detecting enterovirus target sequences. (I) specifically and selectively recognizes the enterovirus genome. (I)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of ABB56762 to ABB56771; and (b) a sequence required for selected amplification or detection reaction. Also described: (I) a kit (KI) comprising (I), and one or more container that contains (I); and (2) detecting (MI) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABB56764
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Septimently and rapidly detects fewer than 500 copies of enteroviral sensitively and rapidly detects fewer than 500 copies of enterovirus serotypes. The present secuence represents a viral 5' untranslated polynucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 sequence given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    DB 14; Length 237;
                                                                                                                                                                                                                                                                                                                   Human poliovirus 1 5' untranslated polynucleotide sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0; Indels

```
The invention relates to an oligonucleotide (1) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of ABBS6771; and (b) a sequence required for selected amplification or detection reaction. Also described: (1) a kit (K1) comprising (1), and one or more container that contains (1); and (2) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABBS6764 to ABBS6771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (1) (M1) and (K1) are useful for detecting enterovirus target sequence. (1) specifically and rapidly detects fewer than 500 copies of enteroviral senone and allows detection of broad range of enterovirus serotypes. The present sequence represents a viral 5' untranslated polymucleotide sequence given in the exemplification of the present invention.
                                                                                                                                                                                                     Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Score 19; DB 14; Length 237; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an oligonucleotide (1) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of ABB56712 and (b) a sequence required for selected amplification or detection reaction. Also described: (1) a kit (K1) comprising (1), and one or more container that contains (1); and (2) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABB5674 to ABB56771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (1), (M1) and (K1) are useful for detecting enterovirus target sequence. (1), specifically and selectively recognizes the enterovirus genome. (1) specifically and rapidly detects fewer than 500 copies of enteroviral sensitively and rapidly detects fewer than 500 copies of enteroviral speneme and allows detection of broad range of enterovirus serotypes. The present sequence represents a viral 5' untranslated polymucleotide sequence given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                               Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.

                                                                                              The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of AEB56762 to AEB56771; and (b) a sequence required for selected amplification or detection. Also described: (I) a kit (KI) comprising (I), and one or more container that contains (I); and (2) detecting (MI) an enterovirus target sequence, involving: (a) amplifying the target sequence using fitst amplification primer having a sequence consisting essentially of target binding sequence of any one of AEB56764 to AEB56771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (I), (MI) and (MI) are useful for detecting enterovirus target sequences. (I), (MI) and (MI) are useful for detecting enterovirus target sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of ABB56762 to ABB56711, and (b) a sequence required for selected amplification or detection reaction. Also described: (1) a kit
Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                     E broad range of enterovirus serotypes. The viral 5' untranslated polynucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                           specifically and selectively recognizes the enterovirus genome. (I) sensitively and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                           sequence given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human enterovirus 70 5' untranslated polynucleotide sequence.

Also described: (1) a kit (K1) comprising (1), and one or more contains that contains (1); and (2) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of AEBS6761 to AEBS6771 and optionally a sequence required for selected amplification (K1) are useful for detecting the amplified target sequence. (1), (M1) and specifically and selectively recognizes the enterovirus genome. (1) sensitively and rapidly detects fewer than 500 copies of enteroviral
                                                                       to AEB56771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (I), (MI) and (KI) are useful for detecting enterovirus target sequences. (I)
               detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABB56764
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
 comprising (I), and one or more container that contains (I); and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an oligonucleotide (I) consisting of: (a) the
                                                                                                                             specifically and selectively recognizes the enterovirus genome. (I) sensitively and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes, present sequence represents a viral 5' untranslated polynucleotide
                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                               ;
                                                                                                                                                                                                             sequence given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human poliovirus 1 5' untranslated polynucleotide sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     target binding sequence of an oligomucleotide chosen from any one of the target binding sequence of an oligomucleotide chosen from any one of the 10 sequence of ABB5672 to ABB6771; and (b) a sequence required for selected amplification or detection reaction. Also described: (1) a kit (KI) comprising (II), and one or more container that contains (I); and (2) detecting (MI) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABB5674 to ABB56771 and optionally a sequence required for selected amplification reaction, and (b) detecting the amplified target sequence. (1), (MI) and (KI) are useful for detecting enterovirus target sequences. (1) specifically and selectively recognizes the enterovirus genome. (1) sensitively and rapidly detects fewer than 500 copies of enteroviral sensitively and allows detection of broad range of enterovirus serotypes. The present sequence represents a viral 5° untranslated polymucleotide sequence given in the exemplification of the present invention.

The invention relates to an oligonucleotide (1) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of ABB56762 to ABB56771; and (b) a sequence required for selected amplification or detection reaction. Also described: (1) a kit (K1) comprising (1), and one or more container that contains (1); and (2) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABB56764 to ABB5671 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (1), (M1) and (K1) are useful for detecting enterovirus target sequence. (1), specifically and selectively recognizes the enterovirus genome. (1) specifically and selectively recognizes the enterovirus genome. (1) sensitively and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes. The present sequence represents a viral 5, untranslated polymorized the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.

target binding sequence of an oligonucleotide chosen from any one of the los sequence of ABB56752 to ABB56771; and (b) a sequence required for selected amplification or detection reaction. Also described: (1) a kit (K1) comprising (1), and one or more container that contains (1); and (2) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABB56764 to ABB56771 and optionally a sequence required for selected amplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            reaction; and (b) detecting the amplified target sequence. (I), (M1) and (M1) are useful for detecting enterovirus target sequences. (I) specifically and selectively recognizes the enterovirus genome. (I) sensitively and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes. The present sequence represents a viral 5' untranslated polymocleotide sequence given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an oligonucleotide (I) consisting of: (a) the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human coxsackievirus B3 5' untranslated polynucleotide sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        100.0%; Score 19; DB 14; Length 238; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of ABBS6721; and (b) a sequence required for selected amplification or detection reaction. Also described: (1) akit (K1) comprising (I), and one or more container that contains (I); and (2) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABBS6764 to ABBS6771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (I), (M1) and (K1) are useful for detecting enterovirus target sequence. (I), (M1) and specifically and selectively recognizes the enterovirus genome. (I)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             specifically and selectively recognizes the enterovirus genome. (I) sensitively and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes. The present sequence represents a viral; untranslated polymucleotide sequence given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                  8
                                                                                                                                                                 The invention relates to an oligonucleotide (1) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the target binding sequence of ABB56771; and (b) a sequence required for selected amplification or detection reaction. Also described: (1) a kit (K1) comprising (1), and one or more container that contains (1); and (2) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABB56764 to ABB56771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (1), (M1) and (K1) are useful for detecting enterovirus target sequences. (1), (M1) and specifically and selectively recognizes the enterovirus genome. (1) specifically and selection of broad range of enterovirus penome and allows detects fewer than 500 copies of enteroviral present sequence represents a viral 5' untranslated polymucleotide sequence contains the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                              Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.

```
The invention relates to an oligomucleotide (I) consisting of: (a) the target binding sequence of an oligomucleotide chosen from any one of the carget binding sequence of ABBS6771; and (b) a sequence required for selected amplification or detection reaction. Also described: (l) a kit (KI) comprising (I), and one or more container that contains (I); and (2) detecting (MI) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABBS676 to ABBS6771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (I), (MI) and (XI) are useful for detecting the amplified target sequence. (I), sensitively and selectively recognizes the enterovirus genome. (I) sensitively and rapidly detects fewer than 500 copies of enteroviral sensitively and selection of broad range of enterovirus serotypes. The present sequence represents a viral 5' untranslated polymucleotide sequence given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 oʻ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of AEB56762 to AEB56771; and (b) a sequence required for
Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human coxsackievirus B4 5' untranslated polynucleotide sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ;

ö
selected amplification or detection reaction. Also described: (1) a kit (K1) comprising (1), and one or more container that contains (1); and (2) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence of suppositions as sequence of any one of ABBS674 to ABBS6771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (1), (M1) and (M2) are useful for detecting enterovirus target sequence. (1) specifically and selectively recognizes the enterovirus genome. (1) specifically and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes. The sequence represents a viral 5' untranslated polynucleotide sequence given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the lo sequence of ABBS6772 to ABBS6771; and (b) a sequence required for selected amplification or detection reaction. Also described: (1) a kit (K1) comprising (I), and one or more container that contains (I); and (2) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABBS6764 to ABBS6771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence: (I), (M1) and specifically and selectively recognizes the enterovirus genome. (I)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.

The invention relates to an oligonucleotide (1) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of ABS5672 to ABS577; and (b) a sequence required for selected amplification or detection reaction. Also described: (1) a kit (K1) comprising (1), and one or more container that contains (1); and (2) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABS5674 to ABS56771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (1), (M1) and (K1) are useful for detecting enterovirus target sequences. (1) specifically and selectively recognizes the enterovirus genome. (1) specifically and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes. The present sequence represents a viral 5' untranslated polynucleotide
                                                                                                                                                                         ö
                 genome and allows detection of broad range of enterovirus serotypes. The present sequence represents a viral 5' untranslated polynucleotide sequence given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                         Gaps
 sensitively and rapidly detects fewer than 500 copies of enteroviral
                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human coxsackievirus B3 5' untranslated polynucleotide sequence

target binding sequence of an original control of the sequence of ABB5672 to ABB5671; and (b) a sequence required for 10 sequence of ABB5672 to ABB56771; and (b) a sequence required for selected amplification or detection reaction. Also described: (1) a kit (K1) comprising (1), and one or more container that contains (1); and (2) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABB56774 to ABB56771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (1), (M1) and (K1) are useful for detecting enterovirus target sequence. (1) and specifically and selectively recognizes the enterovirus genome. (1) sensitively and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus servicypes. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an oligonucleotide (I) consisting of: (a) the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  present sequence represents a viral 5' untranslated polynucleotide sequence given in the exemplification of the present invention.
                                                                                                                                  Human coxsackievirus B1 5' untranslated polynucleotide sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human coxsackievirus B6 5' untranslated polynucleotide sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 100.0%; Score 19; DB 14; Length 238; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an oligomucleotide (I) consisting of: (a) the target binding sequence of an oligomucleotide chosen from any one of the consequence of ABBS6771; and (b) a sequence required for selected amplification or detection reaction. Also described: (I) a kit (KI) comprising (I), and one or more container that contains (I); and (2) detecting (MI) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of AEBS6764 to ABBS6771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (I), (MI) and (KI) are useful for detecting the amplified target sequence. (I) specifically and selectively recognizes the enterovirus genome. (I) specifically and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes. The presents sequence represents a viral 5, untranalated polymorleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ;

target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of ABB5672 to ABB5671; and (b) a sequence required for selected amplification or detection reaction. Also described: (1) and one or more contains that contains (1); and (2) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABB5674 to ABB56771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplification transpersed to sequence. (1) (M1) and (M2) are useful for detecting enterovirus target sequence. (1) (M1) and selectively recognizes the enterovirus genome. (1) sensitivally and selectively fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes. The present sequence represents a viral 5' untranslated polynucleotide.
                                                                                                                                                                                                                                                      Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an oligonucleotide (I) consisting of: (a) the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               sequence given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        100.0%; Score 19; DB 14; Length 238; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an oligonucleotide (1) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of ABBS6772 to ABBS6771; and (b) a sequence required for selected amplification or detection reaction. Also described: (1) a kit (K1) comprising (1), and one or more container that contains (1); and (2) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABBS6764 to ABBS6771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (1), (M1) and (X1) are useful for detecting enterovirus target sequence. (1) specifically and selectively recognizes the enterovirus genome. (1) specifically and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes. The present sequence given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human coxsackievirus B6 5' untranslated polynucleotide sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ;

The invention relates to an oligonucleotide (1) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the consequence of ABB5671; and (b) a sequence required for selected amplification or detection reaction. Also described: (1) a kit (K1) comprising (1), and one or more container that contains (1); and (2) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABB5674 to ABB56771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (1), (M1) and (K1) are useful for detecting enterovirus target sequence. (1), (M1) and specifically and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes. The present sequence represents a viral 5' untranslated polymucleotide sequence given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                    Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of AEB56762 to AEB56771; and (b) a sequence required for

selected amplification or detection reaction. Also described: (1) a kit (K1) comprising (1), and one or more container that contains (1); and (2) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABB56764 to ABB56771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (1), (M1) and (K1) are useful for detecting enterovirus target sequences. (1) specifically and selectively recognizes the enterovirus genome. (1) sensitively and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes. The present sequence represents a consensus viral 5' untranslated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of ABB56762 to ABB5671; and (b) a sequence required for selected amplification or detection reaction. Also described: (1) akit (K1) comprising (I), and one or more container that contains (I); and (2) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABB56764 to ABB56771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (1), (M1) and (K1) are useful for detecting enterovirus target sequences. (1)

The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of AEB56762 to AEB56771; and (b) a sequence required for selected amplification or detection reaction. Also described: (I) a kit (KI) comprising (I), and one or more container that contains (I); and (2) detecting (MI) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of AEB56764 to AEB56771 and Optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (I) (KI) are useful for detecting enterovirus target sequences. (I) (MI) and
specifically and selectively recognizes the enterovirus genome. (I) ensistively and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes. The present sequence represents a viral 5' untranslated polynucleotide sequence given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       specifically and selectively recognizes the enterovirus genome. (I) sensitively and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes. Present sequence represents a viral 5' untranslated polynucleotide sequence given in the exemplification of the present invention.
                                                                                                                                                                                                        Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          target binding sequence of an oligonuclectide chosen from any one of the selected amplification or detection reaction. Also described: (1) a kit (K1) comprising (N1) and one or more contains (1); and (2) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ARBS6774 to ARBS6771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (1), (M1) are useful for detecting enterovirus target sequence. (1), (M1) and (M1) are useful for detecting enterovirus target sequence. (1), (M1) and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         specifically and selectively recognizes the enterovirus genome. (I) sensitively and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              enterovirus serotypes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  a
                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an oligonucleotide (1) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of ABBS671; and (b) a sequence required for selected amplification or detection reaction. Also described: (1) a kit (K1) comprising (1), and one or more container that contains (1); and (2) detecting (M1) an enterovitus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABBS676 to ABBS6771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (1), (M1) and (K1) are useful for detecting enterovirus target sequences. (1) specifically and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes. The present sequence represents a viral 5' untranslated polymucleotide sequence given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                            Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.

The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of ABBS6712 to ABBS671; and (b) a sequence required for selected amplification or detection reaction. Also described: (I) a kit (KI) comprising (I), and one or more container that contains (I); and (2) detecting (MI) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABBS6764 to ABBS6771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (I), (MI) and (KI) are useful for detecting enterovirus target sequences. (I) specifically and selectively recognizes the enterovirus genome. (I) sensitively and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes. The present sequence represents a viral 5 untranslated polymucleotide specifically and the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

The invention relates to an oligomucleotide (I) consisting of: (a) the target binding sequence of an oligomucleotide chosen from any one of the consequence of ABBS6722 to ABBS6731; and (b) a sequence required for selected amplification or detection reaction. Also described: (1) a kit (K1) comprising (I), and one or more container that contains (I); and (2) of detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABBS6784 consisting essentially of target binding sequence of any one of ABBS6784 consisting and optionally a sequence required for selected amplification reaction, and (b) detecting the amplified target sequence. (I) (M1) and (X1) are useful for detecting enterovirus target sequences. (I) (X1) are useful for detecting enterovirus target sequences. (I) (X2) are useful and selectively recognizes the enterovirus genome. (I) capacitively and selection of broad range of enterovirus serotypes. The present sequence represents a viral 5, untranslated polynucleotide
                                                                    Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an oligonucleotide (I) consisting of: (a) the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human coxsackievirus B3 5' untranslated polynucleotide sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 sequence given in the exemplification of the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an oligonucleotide (1) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the consequence of ABBS6772 to ABBS6771; and (b) a sequence required for selected amplification or detection reaction. Also described: (1) a kit (K1) comprising (1), and one or more container that contains (1); and (2) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABBS674 to ABBS6771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (1), (M1) and (X1) are useful for detecting enterovirus target sequences. (1) specifically and selecting enterovirus target sequence. (1) specifically and selecting enterovirus target sequence. (1) specifically and selection of broad range of enterovirus serotypes. The present sequence represents a viral 5' untranslated polymucleotide consequence given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                        Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

(KI) are useful for detecting enterovirus target sequences. (I) specifically and selectively recognizes the enterovirus genome. (I) sensitively and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes. The present sequence represents a viral 5' untranslated polynucleotide

sequence given in the exemplification of the present

```
target binding sequence of an oligonucleotide chosen from any one of the losequence of ABB56762 to ABB56771; and (b) a sequence required for selected amplification or detection reaction. Also described: (l) a kit (KI) comprising (I), and one or more container that contains (I); and (2) detecting (MI) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence or onsisting essentially of target binding sequence of any one of ABB5674 to ABB56771 and optionally a sequence required for selected amplification reaction, and (b) detecting the amplified target sequence. (I), (MI) and (KI) are useful for detecting enterovirus target sequences. (I) specifically and selectively recognizes the enterovirus genome. (I) sensitively and rapidly detects fewer than 500 copies of enteroviral sensitively and rapidly detects fewer than 500 copies of enteroviral present sequence represents a viral 5' untranslated polymucleotide present sequence given in the exemplification of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                              ď
```

The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of AEB56762 to AEB5671; and (b) a sequence required for selected amplification or detection reaction. Also described: (1) a kit (K1) comprising (I), and one or more container that contains (I); and (2) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of AEB56764 to AEB56771 and optionally a sequence required for selected amplification reaction, and (b) detecting the amplified target sequence. (I), (M1) and

target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of AEB5672 to AEB5671; and (b) a sequence required for sequence of AEB5672 to AEB5671; and (b) a sequence required for selected amplification or detection reaction. Also described: (1) a kit (KI) comprising (I), and one or more container that contains (I); and (2) detecting (MI) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence of the target sequence using first amplification primer having a sequence of any one of AEB5671 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (I), (MI) and (KI) are useful for detecting enterovirus target sequence. (I) specifically and rapidly detects fewer than 500 copies of enteroviral sensitively and rapidly detects fewer than 500 copies of enteroviral present sequence represents a viral 5' untranslated polymucleotide sequence represents a viral 5' untranslated polymucleotide sequence represents a viral 5' untranslated polymucleotide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an oligomucleotide (1) consisting of: (a) the target binding sequence of an oligomucleotide chosen from any one of the 10 sequence of ABES6776 to ABES6771; and (b) a sequence required for selected amplification or detection. Also described: (1) a kit (K1) comprising (1), and one or more container that contains (1); and (2) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABES676 to ABES6771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (1), (M1) and (M1) are useful for detecting enterovirus target sequence. (1), (M1) and (M1) are useful for detecting enterovirus target sequence. (1) specifically and selectively recognizes the enterovirus genome. (1) sensitively and rapidly detects fewer than 500 copies of enteroviral senon and allows detection of broad range of enterovirus serotypes. The present sequence represents a viral 5 untranslated polymucleotide sequence given in the exemplification of the present invention.

                                                   The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of AEB56762 to AEB5671; and (b) a sequence required for selected amplification or detection. Also described: (I) a kit (KI) comprising (I), and one or more container that contains (I); and (2) detecting (MI) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of AEB56764 to AEB56771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (I), (MI) and specifically and selectively recognizes the enterovirus genome. (I) sensitively and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 and allows detection of broad range of enterovirus serotypes. sequence represents a viral 5' untranslated polynucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      sequence given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Score 19; DB 14; Length 238; Pred. The invention describes a polymerase chain reaction (PCR) and primers for detecting nucleic acids from the diabetogenic coxsackie B virus-4 (CBV-4) strain VD221, (Particularly VB1, VP2, VP3, VP4, P24, P24, P28, P26, P37, P38, P36, P30 and P3D nucleic acids). The methods and primers are used for the detection of CBV-4 strain VD2921 which is associated with diabetes (diabetogenic enterovirus). Early detection of the diabetes e.g. detection of diabetogenic enterovirus RNA in peripheral mononuclear cells, can improve prognosis by allowing treatment e.g. with antiviral drugs, to prevent further loss of beta cells and severe long term consequences of diabetes including blindness, renal failure and leg amputations. This sequence repersents a diabetogenic coxsackie B virus 4 (CBV-4) strain VD2921 associated polynucleotide
                                                                                                                                                                                                                                                                                                Polymerase chain reaction and primers for detecting nucleic acids from
the diabetogenic coxsackie B virus-4 strain VD2921.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of ABS6771; and (b) a sequence required for selected amplification or detection reaction. Also described: (I) a kit (KI) comprising (I), and one or more container that contains (I); and (2) detecting (MI) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABB6764 to ABB56771 and optionally a sequence required for selected amplification reaction; and (b) detecting enterovirus target sequence. (I), (MI) and (XI) are useful for detecting enterovirus target sequences. (I) specifically and selectively recognizes the enterovirus genome. (I) specifically and selectively recognizes the enterovirus genome. (I) sensitively and rapidly detects fewer than 500 copies of enteroviral consent sequence represents a viral S, untranslated polynucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Coxeackie virus strain VD2921; diabetogenic coxsackie B virus-4; CBV-4; strain VD2921; VD1; VP2; VP3; VP4; P2A; P2B; P2C; P3A; P3B; P3C; P3D; diabetes; diabetogenic entervirus; beta cell loss; blindness; renal failure; leg amputation; ds.

                                                                                                                                                                                                                                                               ö
                                                    The invention describes a polymerase chain reaction (PCR) and primers for detecting nucleic acids from the diabetogenic coxsackie B virus-4 (CBV-4) strain VD2921, (particularly VP1, VP2, VP3, VP4, P2A, P2B, P2C, P3A, P3B, P3C and P3D nucleic acids). The methods and primers are used for the detection of CBV-4 strain VD2921 which is associated with diabetes (diabetogenic enterovirus). Early detection of the diabetes e.g. certain volume of cBV-4 strain VD2921 which is peripheral monouclear detection of diabetogenic enterovirus RNA in peripheral monouclear cells, can improve prognosis by allowing treatment e.g. with antiviral consequences of diabetes including blindness, renal failure and leg amputations. This sequence represents a diabetogenic coxsackie B virus 4
Polymerase chain reaction and primers for detecting nucleic acids from the diabetogenic coxsackie B virus-4 strain VD2921.

site (TRES) of wild-type poliovirus type 1 Mahoney. The invention provides non-pathogenic, oncolytic, recombinant polioviruses (1) in which the IRES of the wild-type poliovirus is exchanged with the IRES of another picornavirus, such as human rhinovirus type 2, and optionally the P1, P3 or 3' untranslated region is exchanged with that of Sabin poliovirus. (1) may contain a composite IRES encompassing IRES domains from both wild-type poliovirus and from another virus. (1) are useful for treating malignant tumors such as glioblastoma multiforme, and epidermoid carcinomas (claimed). (Updated on 15-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Monitoring microbiological quality of water, useful particularly for controlling water purification, uses oligonucleotide probes to detect at

                                                                                                                                                                                         셤
                                            The present invention relates to a method for monitoring microbiological quality of an aqueous environmental medium that potentially contains many different microorganisms. A reference set of at least three microorganisms is chosen that, separately or collectively, represent microbiological quality. The test medium is treated, then any microorganisms, or their fragments, in the treated medium is contacted with a set of at least three probes for specific identification and multiple determination of selected microorganisms. This determination represents the level of microbiological quality. The method is useful for identifying and quantifying microorganisms in water and provides results that are used to control water purification/production processes. The present sequence is a probe which was used to illustrate the invention. (Updated on 07-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to a method for monitoring microbiological quality of an aqueous environmental medium that potentially contains many different microorganisms. A reference set of at least three microorganisms is chosen that, separately or collectively, represent microbiogical quality. The test medium is treated, then any microbiogical quality. The test medium is treated, then any microcorganisms, or their fragments, in the treated medium is contacted with a set of at least three probes for specific identification and

A reference set of at least three microorganisms is chosen that, separately or collectively, represent microbiological quality. The test medium is treated, then any microorganisms, or their fragments, in the treated medium is contacted with a set of at least three probes for specific identification and multiple determination of selected microorganisms. This determination represents the level of microbiological quality. The method is useful for identifying and quantifying microorganisms in water and provides results that are used to control water purification/production processes. The present sequence is a probe which was used to illustrate the invention.
multiple determination of selected microorganisms. This determination represents the level of microbiological quality. The method is useful for identifying and quantifying microorganisms in water and provides results that are used to control water purification/production processes. The present sequence is a probe which was used to illustrate the invention. (Updated on 07-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Monitoring microbiological quality of water, useful particularly for controlling water purification, uses oligonucleotide probes to detect at least three representative microbes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a method for monitoring microbiological
                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Mabilat C, Vachon C, Lacroix B, Vernet G;

The invention describes a polymerase chain reaction (PCR) and primers for detecting nucleic acids from the diabetogenic coxsackie B virus-4 (CBV-4) strain VD221, (particularly VP1, VP2, VP3, VP4, P2A, P2B, P2C, P3A, P3B, P3C and P3D nucleic acids). The methods and primers are used for the detection of CBV-4 strain VD291 which is associated with diabetes (diabetogenic enterovirus). Early detection of the diabetes e.g. detection of diabetogenic enteroviral RNA in peripheral mononuclear
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   cells, can improve prognosis by allowing treatment e.g. with antiviral drugs, to prevent further loss of beta cells and severe long term consequences of diabetes including blindness, renal failure and leg amputations. This sequence represents a diabetogenic coxsackie B virus 4 (CBV-4) strain VD2921 associated polynucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Polymerase chain reaction and primers for detecting nucleic acids from the diabetogenic coxsackie B virus-4 strain VD2921.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention describes a polymerase chain reaction (PCR) and primers for detecting nucleic acids from the diabetogenic coxsackie B virus-4 (CBV-4) strain VD291, (particularly VP1, VP2, VP3, VP4, P28, P28, P22, P32, P33, P38, P36, P30 and P30 nucleic acids). The methods and primers are used for the detection of CBV-4 strain VD2921 which is associated with diabetes (diabetogenic enterovirus). Early detection of the diabetes e.g. detection of diabetogenic enteroviral mononuclear cells, can improve prognosis by allowing treatment e.g. with antiviral drugs, to prevent further loss of beta cells and severe long term
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      consequences of diabetes including blindness, renal failure and leg amputations. This sequence represents a diabetogenic coxsackie B virus 4 (CBV-4) strain VD2921 associated polynucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Polymerase chain reaction and primers for detecting nucleic acids from the diabetogenic coxsackie B virus-4 strain VD2921.

                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                   The invention describes a polymerase chain reaction (PCR) and primers for detecting nucleic acids from the diabetogenic coxsackie B virus-4 (CBV-4) strain VD291, (particularly VP1, VP2, VP3, VP4, P2A, P2B, P2C, P3A, P3B, P3C and P3D nucleic acids). The methods and primers are used for the detection of CBV-4 strain VD2921 which is associated with diabetes edetection of CBV-4 strain VD2921 which is associated with diabetes can detection of the diabetes enderection of the diabetes enderection of the diabetes of can improve prognosis by allowing treatment e.g. with antiviral cultigs, to prevent further loss of beta cells and severe long term consequences of diabetes including blindness, renal failure and leg amputations. This sequence represents a diabetogenic coxsackie B virus 4
                                                                                                                               Polymerase chain reaction and primers for detecting nucleic acids from the diabetogenic coxsackie B virus-4 strain VD2921.

                                                                                                                                      The invention describes a polymerase chain reaction (PCR) and primers for detecting nucleic acids from the diabetogenic cossackie B virus-4 (CBV-4) strain VD2921, (particularly VP1, VP2, VP3, VP4, P2A, P2B, P2C, P3A, P3B, P3C and P3D nucleic acids). The methods and primers are used for the diabetogenic enterovirus). Barly detection of the diabetes e.g. detection of GBV-4 strain VD2921 which is associated with diabetes e.g. detection of diabetogenic enteroviral RNA in peripheral monounclear cells, can improve prognosis by allowing treatment e.g. with antiviral drugs, to prevent further loss of beta cells and severe long term consequences of diabetes including blindness, renal failure and leg amputations. This sequence repersents a diabetogenic coxeackie B virus 4 (CBV-4) strain VD2921 associated polynucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention describes a polymerase chain reaction (PCR) and primers for detecting nucleic acids from the diabetogenic coxsackie B virus-4 (CBV-4) strain VD2921, (Ppt. P23, VP4, P23, VP4, P23, VP4, P23, PP3, PP4, P24, PP3, PP3, PP4, PP3 and PP3 mucleic acids). The methods and primers are used for the detection of CBV-4 strain VD2921 which is associated with diabetes (diabetogenic enterovirus). Early detection of the diabetes e.g. detection of diabetogenic enteroviral RNA in peripheral monounclear cells, can improve prognosis by allowing treatment e.g. with antiviral drugs, to prevent further loss of beta cells and severe long term
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CBV-4;

The methods and primers are used for the detection of CBV-4 strain VD2921 which is associated with diabetes (diabetogenic enterovirus). Barly detection of the diabetes e.g. detection of diabetogenic enterovirus and PNA in peripheral monouclear cells, can improve prognosis by allowing treatment e.g. with antiviral drugs, to prevent further loss of beta cells and severe long term consequences of diabetees including blindness, renal failure and leg amputations. This sequence repersents a diabetogenic coxsackie B virus 4 (CBV-4) strain VD2921 associated polynucleotide
consequences of diabetes including blindness, renal failure and leg
amputations. This sequence represents a diabetogenic coxsackie B virus
(CBV-4) strain VD2921 associated polynucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Polymerase chain reaction and primers for detecting nucleic acids from the diabetogenic coxsackie B virus-4 strain VD2921.

The methods and primers are used for the detection of CBV-4 strain VD2921 which is associated with diabetes detection of GBV-4 strain VD2921 which is associated with diabetes especial centerovirus). Early detection of the diabetes e.g. detection of diabetogenic enterovirus INA in peripheral monourclear cells, can improve prognosis by allowing treatment e.g. with antiviral drugs, to prevent further loss of beta cells and severe long term consequences of diabetes including blindness, renal failure and leg amputations. This sequence represents a diabetegenic coxsackie B virus 4 (CBV-4) strain VD2921 associated polynucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Coxsackie virus strain VD2921; diabetogenic coxsackie B virus-4; CBV-4;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Polymerase chain reaction and primers for detecting nucleic acids from the diabetogenic coxsackie B virus-4 strain VD2921.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention describes a polymerase chain reaction (PCR) and primers for detecting nucleic acids from the diabetogenic coxeackie B virus-4 (CBV-4) strain VD2921, (particularly VP1, VP2, VP3, VP4, P24, P24, P28, P26, P33, P3B, P3C and P3D nucleic acids). The methods and primers are used for the detection of CBV-4 strain VD2921 which is associated with diabetes edetection of GBV-8 strain VD2921 which is passociated with diabetes edgenic enterovirus). Barly detection of the diabetes e.g. detection of diabetogenic enteroviral RNA in peripheral mononuclear cells, can improve prognosis by allowing treatment e.g. with antiviral drugs, to prevent further loss of beta cells and severe long term consequences of diabetes including blindness, renal failure and leg amputations. This sequence repersents a diabetogenic coxeackie B virus 4 (CBV-4) strain VD2921 associated polynucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CBV-4;

detecting nucleic acids from the diabetogenic coxsackie B virus-4 (CBV-4 strain VD2921, (particularly VP1, VP2, VP3, VP4, P2A, P2B, P2C, P3A, P3E P3C and P3D nucleic acids). The methods and primers are used for the detection of CBV-4 strain VD2921 which is associated with diabetes (diabetogenic enterovirus). Early detection of the diabetes e.g. detection of diabetogenic enteroviral RNA in peripheral mononuclear cells, can improve prognosis by allowing treatment e.g. with antiviral consequences of diabetes including blindness, renal failure and leg amputations. This sequence represents a diabetogenic coxsackie B virus (CBV-4) strain VD2921 associated polynucleotide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to a new bicistronic retroviral vector. These are used for (over) expression of proteins, suppressing expression of fnon-) viral RNA and/or proteins by the antisense technique, e.g. to suppress a dominant-negative phenotype, also infectious viral particles that contain the vectors, in gene therapy, particularly for control of guest versus host disease, especially where haematopoietic cells are transduced with the vector or where T cells are transduced, for adoptive immunotherapy, but also for treating severe combined immune deficiency syndrome and for expression cloning of genes. The present sequence is a vector sequence fragment shown in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                        Bicistronic retroviral vector, useful in gene therapy, particularly of graft versus host disease, contains components of both murine embryonic stem cell and myeloproliferative sarcoma viruses.
                                                                                                                                                                                   immunosuppressive; gene therapy; vector; bicistronic retroviral vector; severe combined immune deficiency syndrome; protein expression;

(I) is useful as vaccine or vector in targeting genes of interest to specific calls or tissues. (I) is also useful for diagnostic purposes, e.g. to identify virulent, versus nonvirulent strains of an enterovirus. The present sequence represents the 5'NTR (non-translated region) sequence of echo virus (ECVL2)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Recombinant enterovirus genome for use as vector or vaccine, modified by replacing a part or all of its 5'non-translated region by 5'NTR of enterovirus genome that encodes virus modified in tropism or virulence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

The invention provides an enterovirus genome (1) for use as a vector or vaccine, modified to produce a virus (V1) having a restricted or altered species or tissue tropism, compared to an equivalent unmodified virus, or modified to produce an attenuated virus (V2), by replacing a part or all of the 5'non-translated region (5'NTR) of (1) with a 5'NTR of an enterovirus genome that encodes V1 or V2. (1) is useful as vaccine or vector in targeting genes of interest to specific cells or tissues. (1) is also useful for diagnostic purposes, e.g. to identify virulent, versus nonvirulent strains of an enterovirus. The present sequence represents
                                                                                                                                                                                                                                                                     Recombinant enterovirus genome for use as vector or vaccine, modified by replacing a part or all of its 5'non-translated region by 5'NTR of enterovirus genome that encodes virus modified in tropism or virulence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (non-translated region) of a non-cardiovirulent enterovirus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Score 19; DB 4; Length 660; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention provides an enterovirus genome (I) for use as a vector or vaccine, modified to produce a virus (VI) having a restricted or altered species or tissue tropism, compared to an equivalent unmodified virus, or modified to produce an attenuated virus (V2), by replacing a part or all of the 5'non-translated region (5'NTR) of (I) with a 5'NTR of an enterovirus genome that encodes VI or V2. (I) is useful as vaccine or vector in targeting genes of interest to specific cells or tissues. (I) is also useful for diagnostic purposes, e.g. to identify virulent, versus nonvirulent strains of an enterovirus. The present sequence represents the 5'NTR (non-translated region) of the cardiovirulent enterovirus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Recombinant enterovirus genome for use as vector or vaccine, modified by replacing a part or all of its 5'non-translated region by 5'NTR of enterovirus genome that encodes virus modified in tropism or virulence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the to sequence of ARBS672 to ARBS671; and (b) a sequence required for selected amplification or detection. Also described: (1) a kit (KI) comprising (I), and one or more container that contains (I); and (2) detecting (MI) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ARBS6764 to ARBS6771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (I), (MI) and (KI) are useful for detecting enterovirus target sequence. (I) specifically and selectively recognizes the enterovirus genome. (I) specifically and rapidaly detects fewer than 500 copies of enterovirus serotypes. The present sequence represents a coxsackie virus B5 polynucleotide sequence, which is given in the exemplification of the present invention. Note: the present sequence is designated as SSQ ID NO:67 in the Sequence Listing. Use the drawings.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

The vector comprises a promoter operably linked to a nucleotide sequence comprising at least two cistrons and at least one nucleotide sequence comprising an internal ribosome entry site (IRRS) selected from Human enterovirus 71 (EV71), Hepatitis C virus (HCV), or Encephalomyocarditis virus (EMCV). The invention also provides a method for screening of anti-viral compounds using the IRRS. The invention is useful for the genetic treatment of patients with cystic fibrosis, hemophilia A or B Duchenne or Becker type myopathy, cancer, AIDS and other bacterial or infectious diseases due to a pathogenic organism and in gene therapy. The present sequence is the enterovirus 71 5'
sequence or its functional part, derivative or analogue of the said virus. The invention is useful for detecting and/or identifying a Prima7 enterovirus in a sample and for diagnosing an enteroviral genus related disease. The vaccine or medicament prepared from the Prima7 virus is useful for preventing and/or treating a Prima7-related disease. The invention is also useful in gene therapy. The present sequence is Prima7 virus 5' UTR region DNA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention provides a system for making SARS-coronavirus virus -like particles (SARS-COV-VIPS) comprising one or more recombinant vectors that expresses the SARS-COV E (small membrane)-protein, SARS-COV M (membrane)-protein and SARS-COV E (spike)-protein. The invention is useful for inducing cellular and/or humoral immune response. The invention is also useful to reduce the symptoms of SARS-COV infections and in vaccine preparations. The present sequence is Poliovirus type I strain mahoney internal ribosomal entry site (IRES) coha, This coha sequence is used in the preparation of plasmid for the expression of SARS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New system comprising one or more recombinant vectors that expresses the SARS-COV E-protein, SARS-COV M-protein, and SARS-COV S-protein, useful for making SARS-coronavirus virus-like particles.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SARS-coronavirus virus-like particle; SARS-COV-VLP; cellular immune response; humoral immune response; vaccine; immunogenicity; cytotoxic T-lymphocyte; internal ribosomal entry site;

The invention provides an enterovirus genome (1) for use as a vector or vaccine, modified to produce a virus (V1) having a restricted or altered species or tissue tropism, compared to an equivalent unmodified virus, or modified to produce an attenuated virus (V2), by replacing a part or all of the 5'non-translated region (5'NTR) of (1) with a 5'NTR of an enterovirus genome that encodes V1 or V2. (1) is useful as vaccine or vector in targeting genes of interest to specific cells or tissues. (1)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                Recombinant enterovirus genome for use as vector or vaccine, modified by replacing a part or all of its 5'non-translated region by 5'NTR of enterovirus genome that encodes virus modified in tropism or virulence.

                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is that of a known internal ribosome entry site (IRES) element contained in the 5' untranslated region of poliovirus mRNA. The invention provides a method of creating an artificial IRES element having an adenine-rich (40-100 mol*) nucleic acid block of at least 25 nucleotides and capable of causing cap-independent translation of a downstream nucleotide sequence of interest in eukaryotic cells, such as plant, animal or yeast cells (claimed). A method of identifying nucleic acid elements having IRES activity involving genome database searches is also provided. The methods allow the creation or identification of IRES elements that are universal with cross-kingdom and
is also useful for diagnostic purposes, e.g. to identify virulent, versus nonvirulent strains of an enterovirus. The present sequence represents the enterovirus Coxsackievirus B3 (CVB3) 5' NTR (non-translated region)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Creating nucleic acid sequence for carrying out translation by internal ribosome entry site element and expressing nucleotide sequence of interest in eukaryotic cell, by creating a nucleic acid having adeninerich block.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gleba Y;

The invention relates to a novel method for detecting and/or quantifying Human metapneumovirus (hMPV) in a sample comprising providing at least cone probe or primer specific for a nucleic acid sequence of hMPV, contacting the one probe and/or primer with the sample to allow annealing of the probe and/or primer with the sample to allow annealing and/or quantifying the nucleic acid sequence using the annealed probe and/or primer. The method of the invention may be useful for detecting and/or quantifying Human metapneumovirus (hMPV) in a sample. The current sequence is that of the Human coxsackievirus BI complete genomic DNA of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Detecting and/or quantifying human, metapneumovirus (hMPV) in a sample comprises contacting the at least one probe and/or primer with the sample to allow annealing of the probe and/or primer with the nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The invention relates to the production of platelet-derived growth factor (PDGF) comprising a transgenic mammal whose somatic and germ cells comprise a nucleic acid sequence (I) encoding PDGF, operably linked to a promoter directing expression into mammalian gland epithelial cells, and obtaining the milk from the transgenic mammal where at least 30% of the PDGF in the milk is as a dimer. Also described is a method of producing a transgenic mammal capable of expressing an active PDGF molecule in milk.
                                                                                                                                                                                                                                                                                                                                                                                                                                                   Platelet-derived growth factor expression cassette insert used in pBC701.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Production of platelet derived growth factor (PDGF) comprises expression in the milk of a non-human transgenic animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Pharmaceutical compositions can be obtained from this milk and can be used to stimulate or enhance the wound healing process, in particular diabetic foot ulcers, decubitus ulcers and venous stasis ulcers.

Transgenic POGF (II) can also be used in the treatment of periodontal regeneration, stimulation of bone formation, ophthalmic diseases or healing of prosthetic vascular grafts. (II) can also be used for non-medical applications, e.g., as a supplement for cell culture media or as a component of diagnostic kits. The present sequence represents the platelet-derived growth factor expression cassette insert used in pBC701
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Platelet-derived growth factor; PDGF; transgenic; milk; gene; wound healing; diabetic foot ulcer; decubitus ulcer; ophthalmic disease; venous stasis ulcer; periodontal regeneration; bone formation; prosthetic vascular graft; pBC701; ds
at least one synthetic nucleotide sequence fixed on a solid substrate detecting hybridisation. The present sequence is the enterovirus type (EV71) cDNA.

                                                                                                                                                                                                                                                                                                                                     The invention provides a method and a kit for detecting and differentiating an enterovirus type 71 (BV71) in a sample. The method involves contacting nucleic acids in the sample with a pair of primers to form an amplification product, contacting the amplification product with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ij
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New kit comprising a pair of oligonucleotide primers for nucleic acid amplification, useful in detecting and differentiating an enterovirus

```
Viral vector that expresses single-chain interleukin-12 and costimulator, useful for treatment of tumors, viral infections, e.g. human immunodeficiency virus, and prion diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a viral vector that includes a nucleic acid encoding a single-chain interleukin-12 (IL-12) and a co-stimulatory protein. Viral vectors and virus particles derived from them are useful for treatment of tumours, infectious diseases (e.g. HIV, hepatitis A, B or C, cytomegalovirus or human papilloma virus), or prion diseases. The present sequence is a triciatronic expression cassette used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         immunosuppressive; gene therapy; vector; bicistronic retroviral vector; severe combined immune deficiency syndrome; protein expression;
                                                                                                                                        Tricistronic expression cassette containing murine coding sequences.
                                                                                                                                                                         cytostatic; virucide; anti-HIV; hepatotropic; neuroprotective; immunostimulant; expression cassette; viral vector; interleukin-12; co-stimulatory protein; cancer; infection; ds; gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 5252 BP; 1347 A; 1386 C; 1300 G; 1219 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention describes a novel nucleic acid (I) comprising elements that encode a signal peptide (SP) that provides transfer of expressed polypeptide into the endoplasmic reticulum, a fragment (FI) of HIV gp41 protein, containing a segment from a hepted repeat region, a transmembrane anchor (MSD) of a type I membrane protein and a flexible linker (hinge) linking FI and MSD, therefore the formula of (I) is SP-FI-hinge-MSD. The products of the invention have antiviral activity and act as HIV replication inhibitors. Vectors containing (I), also T lymphocytes or hematopoietic stem cells transfected in vitro with (I), are used in gene therapy of HIV infection. (Updated on 11-SEP-2003 to standardise OS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New nucleic acid encoding membrane-anchored gp41 fusion protein, useful for gene therapy of human immunodeficiency virus (HIV) infection, prevents entry of virus into cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a new bicistronic retroviral vector. These are used for (over) expression of proteins, suppressing expression of non-) viral RNA and/or proteins by the antisense technique, e.g. to suppress a dominant-negative phenotype, also infectious viral particles that contain the vectors, in gene therapy, particularly for control of guest versus host disease, especially where haematopoietic cells are transduced with the vector or where T cells are transduced, for adoptive immunotherapy, but also for treating severe combined immune deficiency syndrome and for expression cloning of genes. The present sequence is a vector sequence shown in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Bicistronic retroviral vector, useful in gene therapy, particularly of graft versus host disease, contains components of both murine embryonic stem cell and myeloproliferative sarcoma viruses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                                   The present invention relates to a new bicistronic retroviral vector. These are used for (over) expression of proteins, suppressing expression of (non-) viral RNA and/or proteins by the antisense technique, e.g. to suppress a dominant-negative phenotype, also infectious viral particles that contain the vectors, in gene therapy, particularly for control of guest versus host disease, especially where haematopoietic cells are transduced with the vector or where T cells are transduced, for adoptive immunotherapy, but also for treatling severe combined immune deficiency syndrome and for expression cloning of genes. The present sequence is a vector sequence shown in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                  Sequence 7185 BP; 1581 A; 2013 C; 1942 G; 1649 T; 0 U; 0 Other;

```
The present invention relates to a new bicistronic retroviral vector. These are used for (over)expression of proteins, suppressing expression of (non-) viral RNA and/or proteins by the antisense technique, e.g. to suppress a dominant-negative phenotype, also infectious viral particles that contain the vectors, in gene therapy, particularly for control of guest versus host disease, especially where haematopoietic cells are transduced with the vector or where T cells are transduced with the vector or where T cells are transduced, for adoptive immunotherapy, but also for treating severe combined immune deficiency syndrome and for expression cloning of genes. The present sequence is a vector sequence shown in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Bicistronic retroviral vector, useful in gene therapy, particularly of graft versus host disease, contains components of both murine embryonic stem cell and myeloproliferative sarcoma viruses.

The present sequence is a vector sequence shown in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Bicistronic retroviral vector, useful in gene therapy, particularly of graft versus host disease, contains components of both murine embryonic stem cell and myeloproliferative sarcoma viruses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a new bicistronic retroviral vector.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a new bicistronic retroviral vector. These are used for (over) expression of proteins, suppressing expression of foot over) viral RNA and/or proteins by the antisense technique, e.g. to suppress a dominant-negative phenotype, also infectious viral particles that contain the vectors, in gene therapy, particularly for control of guest versus host disease, especially where haematopoietic cells are transduced with the vector or where I cells are transduced with the vector or where I cells are transduced, but also for treating severe combined immune deficiency syndrome and for expression cloning of genes. The present sequence is a

These are used for (over) expression of proceins, suppressing expression of (non-) viral RNA and/or proteins by the antisense technique, e.g. to suppress a dominant-negative phenotype, also infectious viral particles that contain the vectors, in gene therapy, particularly for control of guest versus host disease, especially where haematopoietic cells are transduced with the vector or where T cells are transduced, for adoptive immunotherapy, but also for tracting severe combined immune deficiency syndrome and for expression cloning of genes. The present sequence is a
                                                                                                                                                                                                                               Bicistronic retroviral vector, useful in gene therapy, particularly of graft versus host disease, contains components of both murine embryonic stem cell and myeloproliferative sarcoma viruses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to a new bicistronic retroviral vector

(SDVD) gene sequence from the SUDV strain N3. SVDV is the causative agent of swine vesicular disease, which is very similar to foot and mouth of swine vesicular disease, which is very similar to foot and mouth sequence. The invention relates to the wild-type Tawan Yu-Li strain cDNA sequence, and the gene sequences of the mutant SVDV strains N3. H31 and SP7. The mutant SVDV nucleotide sequence can be used in a vaccine for the prophylaxis of swine vesicular disease. The invention also includes a method for differentiating the mutant SVDV nucleotide sequences from the wild type strain of SVDV, coxsackie virus and foot-and-mouth disease wild type strain of SVDV, coxsackie virus and foot-and-mouth disease is not present in the specification, but has been derived from the wild-type Taiwan Xu-Li strain SVDV gene sequence (see AA298117) shown on pages 34-38 of the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Mutant strains of swine vesicular disease virus (SVDV) used in vaccines to prevent swine vesicular disease.

nucleic acid. The invention provides a non-viral vesicie vector for the delivery of nucleic acid to various cardiac cell types. The vesicle vector contains the hepartitis B virus envelope protein in which at least part of the liver targetting sequence is deleted and replaced with a specific cardiac cell targetting sequence. For example, the coxsackie virus B3, Vpl sequence can be used to target the vector to cardiomyocytes. The vesicle vector can be delivered intravenously or intra-arterially rather than by more invasive methods such as direct cardiac injection. It can be used to deliver gene products to replace or

present sequence is that of a coxsackie virus B3 capsid protein VP1

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence represents the full length Swine vesicular disease virus (SVDV) gene sequence from the SVDV strain Taiwan Yu-Li. SVDV is the causative agent of swine vesicular disease, which is very similar to foot and mouth disease. The invention relates to the wild-type Taiwan Yu-Li strain cDNA sequence, and the gene sequences of the mutant SVDV strains N3, H21 and SP7. The mutant SVDV nucleotide sequence can be used in a vaccine for the prophylaxis of swine vesicular disease. The invention also includes a method for differentiating the mutant SVDV nucleotide sequences from the wild type strain of SVDV, coxsacktevirus and foot-and-mouth disease virus through the use of polymerase chain reaction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Mutant strains of swine vesicular disease virus (SVDV) used in vaccines

                                    This sequence represents the full length Swine vesicular disease virus (SDVD) gene sequence from the SVDV strain H21. SVDV is the causative agent of swine vesicular disease, which is very similar to foot and mouth disease. The invention relates to the wild-type Taiwan Yu-Li strain cDNA sequence, and the gene sequences of the mutant SVDV strains N3, H21 and SP7. The mutant SVDV nucleotide sequence can be used in a vaccine for the prophylaxis of swine vesicular disease. The invention also includes a method for differentiating the mutant SVDV nucleotide sequences from the wild type strain of SVDV, coxeackie virus and foot-and-mouth disease virus through the use of polymerase chain reaction. Note: This sequence is not present in the specification, but has been derived from the wild-type Taiwan Yu-Li strain SVDV gene sequence (see AAZ99717) shown on pages 34-38 of the specification
